Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 4, Application US/09861846
Patent No. US20020110852a1
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: ISOLATED HUMAN TRANSPORTER PROTEINS,
TITLE OF INVENTION: MUCLEIC ACID MOLECULES ENCODING HUMAN TRANSPORTER PROTEINS,
TITLE OF INVENTION: AND USES THEREOF
FILE REFERENCE: CL001065
CURRENT APPLICATION NUMBER: US/09/861,846
CURRENT FILING DATE: 2001-05-22
PRIOR APPLICATION NUMBER: 09/752,821
PRIOR FILING DATE: 2001-01-03
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MS-09-861-846-2

No, is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                        Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human neurotransmitter transporter polypeptides referred to as HIPHUM 0000029 and nucleic acid molecules encoding such polypeptides. Sequences of the invention their agonists and antagonists are useful for preparing a medicament for treatment or prophylaxis of disorders such as psychiatric disorders, bipolar disorders, unipolar depression, anxiety, schizophrenia, psychotic disorders, neurological/neurodegenerative disorders and drug dependence. Polynucleotides of the invention are useful as primers and probes. They are also used in gene therapy. The present sequence is human HIPHUM 0000029 protein. The HIPHUM 0000029 gene is located on chromosome 1p21.
                                                                                                      protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EEELDAEDRPAWNSKLQYILAQIGFSVGLGNIWRFPYLCQKNGGGAYLVPYLVLLIIGI 111

One hundred and twenty eight novel nucleic acid sequences, useful for treating and diagnosing e.g. cancer, asthma and Alzheimer's

Claim 6; Page 280-281; 290pp; English.

(NS) can have cytostatic, osteopathic, gynaecological, neuroprotective, antirheumatic, antiarthic, gynaecological, neuroprotective, antirheumatic, antiarthicic, antipsoriatic, ophthalmological, virucide, vasotropic, antiarteriosclerofic, antinflammatcry, dermatological, virucide, anticoagulant, antiarteriosclerofic, antinflammatcry, dermatological, anticoagulant, antidibetic, tranquilliser, antiuler, antidepressant, antidibetic, tranquilliser, antiuler, antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, antidopressant, gastrointestinal, aeuroleptic, cerebroprotective, cootropic and contraceptive activities. The NS can be used in vaccines, of the present invention can be used for treating and antisense therapy. Nucleic acids, expression vectors and antibodies from the present invention can be used for treating and diagnosing e.g. cancer, osteoprosis, endometriosis, degenerative diseases, dystonia, multiple sclerosis, rheumatcoid arthritis, psoriasis, cataracts, restenosis, atherosclerosis, inflammation, skin discorders, glaucoma, obesity, muscular dystropiy, AIDS, infertility, cardiovascular disease, coagulation disease, ischamma, impune immune to ABL39818 represent novel human nucleic acid sequences the proteins given in ABB06037 to ABB06164. The novel sequences disease, epijepsy, angina, neurodegeneration, diabetes, anxiety, depression, schizophrenia, viral disease, gastric ulcers, stroke, Alzheimer's disease and as a contraceptive. Tang YT, Liu C, Drmanac RT;

WPI; 2001-514838/56. N-PSDB; AAI85807 Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune

Claim 20; SEQ ID NO 19768; 1399pp + Sequence Listing; English.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine. Cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or inflammation.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

RESULT 5 ABB11188

ABB11188 standard; peptide; 143 AA.

Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention.

Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer -

N-PSDB; ABA08432.

Claim 20; Page 154; 1963pp; English.

The interior activities) seem cert glowen factor activity;

haematopoiesis regulatory activity; tissue growth activity;

chemocratic or chemokinetic activities; haemostatic, thrombotic or

chemocratic or chemokinetic activities; haemostatic, thrombotic or

thrombolytic activities; receptor or ligand activities; or may be

involved in oncogenesis, cancer cell proliferation or metastasis.

Copending on their biological activities, polypeptides and nucleotides of

the invention are useful for preventing, treating or ameliorating medical

conditions, e.g., by protein or gene therapy. Such conditions include

concers, haematopoietic disorders (e.g., myaloid or lymphold cell

disorders), chronic inflammancry conditions (e.g., asthma or arthritis),

proliferative retinopathy, atherosclerosis, coronary heart disease,

arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal

crepair (or nucleic acids encoding them) may be used to promote wound

crepair (or nucleic acids encoding them) may be used to promote wound

crepair (or borns, incisions and ulcers), while those with

immunomodulatory activities may be used in the treatment of viral,

challing (e.g., of burns, incisions and ulcers), which is those with

contains and fungal infections in addition to immune disorders. Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08255-ABA05574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, or polypeptides against the polypeptides, methods of detecting the nucleotides bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probabble biological activities, and hence have various activities, including cytokine, cell proliferation may differentiation activities; seem cell growth factor activity.

```
The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs)
                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptide for treatment of diseases, diagnostics, raising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomator. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides of pind to polypeptides of the invention. Although novel, many of the bind to polypeptides of the invention. Although novel, many of the comparing an insight into their probable biological activities, and hence of potential therapeutic applications. The polypeptides of the invention may differentiation activities; including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; cell momentopolesis regulatory activity; activit; or inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be conditions, e.g., by protein or gene therapy. Such conditions include conditions are useful for preventing, treating or metastasis.

Cc conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), arthrie prevential is concarry heart disease.
                                                                                                                                                                                       Human; cytokine; cell proliferation; cell differentiation; growth factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       reterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with immunomodularory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject

Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithalial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention.

(HUMA-) HUMAN GENOME SCI INC.

Komatsoulis G, Ruben SM, Rosen CA;

WPI; 2002-121886/16.

An isolated nucleic acid molecule encoding a human secreted protein (SP) is useful in preventing, treating or ameliorating a disorder e.g., Alzheimer's disease and cancers -

Disclosure; Page 473; 496pp; English.

(ABB5734-ABB57456) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone amirow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative collitis; (c) cardiovascular disorders such as myocardial ischaemias; The invention relates to novel genes (ABL01566-ABL01594) and proteins

The invention relates to novel genes (ABL01566-ABL01594) and proteins (ABL57344-ABB573456) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; marrow, breast, astrointestinal tract, liver, lung, or urogenital; hemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial isothemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and contractive and (f) infectious diseases such as viral, bacterial, fungal

parasitic infections.

```

```
neurotransmitter transporter polypeptide comprising a sequence of 259 amino acids, given in the specification. A nucleic acid encoding the protein is useful for detecting a polynucleotide encoding the protein in a biological sample by hybridising the protein-encoding polynucleotide to a nucleic acid material of a biological sample to form a hybridisation complex, and detecting the hybridisation complex. The protein of the invention and its encoding gene are useful for screening for agents which decrease the activity of sodium-dependent neurotransmitter transporter polypeptide by contacting the test compound with the protein or its gene of detecting binding of the test compound to the protein or its gene. A vector comprising the polynucleotide of the invention or a reagent that modulates the activity of the protein or its gene a vector comprising the polynucleotide of the invention or a reagent that contansmitter transporter in a disease. The reagent is useful for treating diseases such as central nervous system disease, where the central nervous system disease, where the central nervous system disease, and their consequences.

disease, and Alzheimer's disease. The polynucleotide of the invention can be used in gene therapy. This sequence represents the 259 amino acid sodium-dependent neurotransmitter transporter protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        or ant/agonist can be used to achieve cytostatic; virucidal; immunomodulatory, antiinflammatory or haemostatic activity. They can be used in the diagnosis and treatment of malignant tumours, haemopathy, HIV infection, immunological diseases and various inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to human sodium neurotransmitter cotransporter protein 8,43 and the cDNA encoding it. Included in the invention is a vector containing the cDNA, a host cell transformed with the vector and an antibody targeting the protein. The protein, polynucleotide, antibody,

```
neurotransmitter transporter polypeptide comprising a sequence of 259
amino acids, given in the specification. A nucleic acid encoding the
protein is useful for detecting a polynucleotide encoding the protein in
a biological sample by hybridising the protein-encoding polynucleotide to
a nucleic acid material of a biological sample to form a hybridisation
complex, and detecting the hybridisation complex. The protein of the
invention and its encoding gene are useful for screening for agents which
decrease the activity of sodium-dependent neurotransmitter transporter
colypeptide by contacting the test compound with the protein or its gene
and detecting binding of the test compound to the protein or its gene
and detecting the polynucleotide of the invention or a reagent that
conclusive activity of the protein or its gene at vector comprising the polynucleotide of the invention or a reagent that
conclusive activity of the protein or its gene is useful for the
preparation of a medicament for modulating the activity of sodium-
dependent neurotransmitter transporter in a disease. The reagent is
useful for treating diseases such as central or peripheral nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Parkinson's disease, corticobasal degeneration, motor neuron disease, dementia, including multiple sclerosis, traumatic brain injury, stroke, post-traumatic brain injury, small-vessel cerebrovascular disease, and Alzheimer's disease. The polynucleotide of the invention can be used in gene therapy. This sequence represents the protein sequence dentified by swissprot Accession No: 008469 relating to the sodium-dependent neurotransmitter transporter protein of the invention.
                                                                                                                                                                                                                                                   Antiparkinsonian; nootropic; neuroprotective; tranquiliser; vulnerary; cerebroprotective; human sodium-dependent neurotransmitter transporter; hybridising; central; peripheral nervous system disease; brain injury; cerebrovascular disease; Parkinson's disease; corticobasal degeneration; motor neuron disease; dementia; multiple sclerosis; post-stroke; tranmatic brain injury; stroke; post-tranmatic brain injury; stroke; post-tranmatic brain injury; stroke; past-stroke; mall-vessel cerebrovascular disease; Alzheimer's disease; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human sodium-dependent neurotransmitter transporter polypeptide, the regulation of which is useful for treating central or peripheral nervous system diseases e.g. brain injuries, Parkinson's disease, and

The present sequence represents a human transporter polypeptide. The specification describes 20685, 579, 17114, 23821, 3384 or 32613 human cransporter pulypeptides. The 20685 transporter is similar to vesicular monoamine transporters. The 20615 transporter is similar to second rearrangements. The 3791 transporter is similar to heurotransmitter-symporters. The 17114 transporter is similar to ABC cransporters. The 32613 transporter is similar to ABC cransporters. The 32613 transporter is similar to ABC cransporters polypeptides and polynuclectides are useful for treating and diagnosing neurological and central nervous system disorders (e.g. and diagnosing neurological and central nervous system disorders (e.g. proliferative disorders (e.g., cancer), infectious disease, cell cangoning disorders. They are also useful for treating and immune and inflammatory disorders. They are also useful for treating and collarious informance of calgonosing disorders involving the spleen (e.g., Hodgkin disease, Niemann-Pick disease), lung (e.g., chronic bronchitis), colon (cirrhosis), uterus and endometrium (e.g., endometrial stronal tumours), colon (e.g., accending inforcition), blood vessels (e.g., Rawasaki erythematosus), haematopoletic stem cells (e.g., Alzhehmer's disease), eart (e.g., myocardial infarction), blood vessels (e.g., Rawasaki ersting), etsits, epididymis, prostate, thyroid (e.g., Graves disease), disorders involving skeletal muscle (e.g., tumour), pancreas (e.g., pancreditis), small intestine (e.g., callac sprue), disorders related to reduced proved the collac sprue), disorders related to reduced proved the collac sprue).
                                                                                                                                Novel human transporter polypeptides useful for treating and diagnosing Parkinson's disease, Hodgkin disease, glomerulonephritis, myocardial infarction, Grave's disease, Alzheimer's disease, anemia, asthma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY72908 standard; Protein; 730 AA.

The present sequence is human NTT7 protein encoded by a CDNA. NTT7 is thought to be a member of the neurotransmitter family of polypeptides.

Compute the sequences are useful for treating psychiatric disorders, anxiety, depression, schizophrenia, phobias, panic disorders, anxiety, disorder, parkinson's disease, central nervous system disorders, stroke, neurological disorders, pani, neuropathic pain, sleep disorders, and diseases in which neurotransmitters are implicated. NTT7 sequences are useful for screening antagonists and agonists of NTT7 and as vaccines for inducing immunological response in a manmal. NTT7 sequences and its cantibodies are useful to configure screening methods for detecting the effect of added compounds on the production of mRNA and polypeptide in cells. NTT7 is useful in conventional low capacity screening methods and calso in high-throughput screening (HTS) formats and is useful for confidentity chomes expressing NTT7 or to purify NTT7 by capacity capacity capacity is useful considered gene, and for chromsome detecting mutations in the associated gene, and for chromsome
                                                                                                                                                                                                         Novel NTT7 polypeptide useful for treating anxiety, depression, schizophrenia, phobia, Parkinson's disease, stroke, pain, and psychiatric, panic, neurological, central nervous system, obsessive compulsive and sleep disorders
                                                                                                              Pangalos M;
